

**LIST OF THE CLAIMS:**

Following is a listing of all claims in the present application, which reflects all the changes made to the currently pending claims:

1-5 (Canceled)

6. (Currently Amended) The spatial image type display according to claim 204, wherein said ~~respective front display surface surfaces of said front display device and rear display device lying in front and behind~~ and said rear display surface display a same image data with different brightness ~~brightnesses to make for a~~ stereoscopic display.

7. (Currently Amended) The spatial image type display according to claim 204, wherein said front display surface and said rear display surface ~~respective display surfaces of said front display device and rear display device lying in front and behind~~ display split image data for a ~~to make~~ stereoscopic display, said split image data images being obtained by splitting the image data to be displayed.

8. (Currently Amended) The spatial image type display according to claim 204, wherein each of said front and rear display devices ~~device~~ is made of an organic EL display ~~each~~.

9. (Currently Amended) The spatial image type display according to claim 204, wherein when three or more display devices are present, a rearmost display device ~~out of said at least two display devices of~~ is made of a liquid crystal display, and each of the other display devices ~~device(s)~~ ~~is/are~~ made of an organic EL display ~~each~~.

10. (Currently Amended) A spatial image type display comprising:
- a frame;
  - a display unit enclosed by said frame;
  - an electric circuit substrate including a display control circuit for displaying images; and
- ~~at least two~~ a plurality of display devices included in said display unit,
- wherein
- said plurality of display devices comprise a front display device having a front display surface and a rear display device aligned next to said front display device having a rear display surface, said front display surface having a plurality of pixels for displaying image data and said rear display surface having a plurality of pixels for displaying image data, the rear display surface displaying substantially same image data and displaying the image data in a substantially same direction with said front display surface,
- each of said plurality of pixels comprises at least one sub-pixel, and
- said front display surface includes a displaying region corresponding to the plurality of pixels of said front display surface, and a transparent region that is adjacent to the display region and is aligned with respective pixel of the plurality of pixels of the rear display surface so that the image data on said rear display surface is transmitted from the transparent region to a viewer.
- ~~said at least two display devices having respective display surfaces for displaying image data in the same direction, said display surfaces being aligned with an appropriate spacing therebetween,~~

~~wherein said display surface of a front display device out of said at least two display devices lying in front and behind has a transparent region for transmitting the image data on said display surface of a rear display device forward.~~

11. (Currently Amended) The spatial image type display according to claim 10, wherein said electric circuit substrate feeds image data signals which are produced by adjusting an amplitude of a video signal to said front and rear respective display devices.

12. (Currently Amended) The spatial image type display according to claim 10 or 11, wherein said front respective display surface ~~surfaces~~ of said front display device and said rear display surface of said rear display device ~~lying in front and behind~~ display the same image data with different brightness ~~brightnesses as the image data to make~~ for a stereoscopic display.

13. (Currently Amended) The spatial image type display according to claim 10 or 11, wherein said front respective display surface ~~surfaces~~ of said front display device and said rear display surface of said rear display device ~~lying in front and behind~~ display split ~~images as the image data~~ for a to make stereoscopic display, said split image data images being obtained by splitting the image data to be displayed.

14. (Currently Amended) The spatial image type display according to claim 10, wherein each of said first and second display devices ~~device~~ is made of an organic EL display each.

15. (Currently Amended) The spatial image type display according to claim 10, wherein the rear ~~a-rearmost display device out of said at least two display devices~~ is made of a liquid crystal display, and the front ~~other display device(s)~~ is/are made of an organic EL display ~~each~~.

16. (Original) The spatial image type display according to claim 10, wherein said image data comprises a number of pixel data.

17. (Original) The spatial image type display according to claim 10, wherein said image data comprises a number of groups of pixel data.

18. (Currently Amended) The spatial image type display according to claim 10, wherein said transparent region is overlapped with a region of the image data of the rear display device ~~with the spacing kept in a direction of an optical axis~~.

19. (Original) The spatial image type display according to claim 11, wherein said amplitudes of the image data signals are set in accordance with a depth of each portion of the stereoscopic image with respect to a reference position, which is an assumed position of a viewer.

20. (New) A spatial image type display having a plurality of display devices, display surfaces of said display devices being aligned with each other and having a spacing therebetween, said display comprising:

a front display device having a front display surface, said front display surface having a plurality of pixels for displaying image data; and

a rear display device aligned with said front display device and having a rear display surface, said rear display surface having a plurality of pixels for displaying image data, the rear display surface displaying substantially same image data and displaying the image data in a substantially same direction with said front display surface,

wherein

each of the plurality of pixels of the front and rear display surfaces comprises at least one sub-pixel, and

said front display surface includes a displaying region corresponding to the plurality of pixels of said front display surface, and a transparent region that is adjacent to the display region and is aligned with respective pixel of the plurality of pixels of the rear display surface so that the image data on said rear display surface is transmitted from the transparent region to a viewer.

21. (New) The spatial image type display according to Claim 9, wherein the rearmost display device includes a rearmost display surface having a plurality of pixels for displaying image data, the rearmost display surface displaying substantially same image data and displaying the image data in a substantially same direction with its preceding display surfaces.

22. (New) The spatial image type display according to claim 21, wherein said front display includes more than one transparent regions, each of which is aligned with the respective plurality of pixels of subsequent display devices located behind the front display device so that the image data on the subsequent display device is transmitted through the more than one transparent regions to the viewer.

23. (New) The spatial image type display according to claim 21, wherein the transparent region of said front display surface has a width sufficient to be aligned with the respective plurality of pixels of subsequent display devices located behind the front display device so that the image data on the subsequent display device is transmitted through the transparent region to the viewer.

24. (New) The spatial image type display according to claim 20, wherein the front display device is made of an organic EL display and the rear display device is made of a liquid crystal display.

25. (New) The spatial image type display according to claim 23, further comprising a backlight that is located behind the rear display device.

26. (New) The spatial image type display according to claim 10, wherein when three or more display devices are present, a rearmost display device is made of a liquid crystal display, and each of the other display devices is made of an organic EL display.

27. (New) The spatial image type display according to claim 15, further comprising a backlight that is located behind the rear display device.

28. (New) The spatial image type display according to claim 9, further comprising a backlight that is located behind the rearmost display device.

29. (New) The spatial image type display according to claim 26, further comprising a backlight that is located behind the rearmost display device.
